

3D MODELS, PIPELINE REFINEMENT, FULL ANALYTIC DISPLAYS

AEMS - Scenario 3

Group 12 - Aditi Ghosh, Brian Daza, Abrar Makki

For our third implementative scenario, we will mainly focus on the refinement of the user and admin interaction pipeline of our AEMS application, as well as refining existing features and pages displaying reports and exhibitions. Therefore, we will be expanding our system's capabilities by expanding upon features such as:

- Real time admin reports, statistics, and overview pages
- Admin exhibitions displaying artworks and associate artists
- Customers browse, experience improved 3D models
- Multiple accounts supported through exhibitions

Part 1: Admin feature refinement:

Through a separate portal for admins, there should be recent statistics available on the website and other credential details. Administrators would be able to create special admin accounts through this portal with their credentials. Tabs on the side allow administrators to access details on customer interactions with artworks. One such tab, the transactions tab, will allow admins to view the total amount of transactions that go through the website. Transactions stored in the database will consist of purchase histories on users and cash flow. Furthermore, exhibitions will also support the adding of multiple artists and users, to better represent the event details and customization of exhibitions displayed onto the system.

Reports & Analytics:

The admin dashboard also includes a "Reports & Analytics" section providing administrators and organizers with an overview of statistics pertaining to their sales, artworks, exhibitions, revenue, and visitors. These insights and reports will allow admin users to better understand the success of their events as well as artworks to further support future decision making regarding strategies, planning, or promotions. These reports will be generated and calculated through the refined and completed pipeline relating user interactions with admin created exhibitions and artworks.

Part 2: Customer feature refinement:

Viewing and Purchasing Artworks:

Customers have access to the "View & Buy Arts" page to view arts in a 3 dimensional manner. This means art listings create credibility by posting these 3D models to the websites for customers to view the details of the artworks and build trust with their audience. The customer when going to their profile will also list database stored transactions and the details of it after

making a purchase. From here they are also able to request support for their purchase. They can also attach a ticket with their written inquiry to the request ticket.

Browsing Exhibitions:

When the customer views the “Upcoming Events” options, the system will display a list of the current and upcoming exhibitions offered by organizers. These exhibitions will be further detailed to display information such as featured artists, highlighted artworks, and full descriptions of the event. The customer also can proceed to purchase tickets for the exhibition, which will then be processed within the purchases page. These purchases as well as its history will be reflected in other analytic pages and reports.
