SCENARIO - 1 : ART EXHIBITION MANAGEMENT SYSTEM (AEMS)

Overview:

AEMS is a software application that is designed to streamline the organization and management of art exhibitions and collections along with improving the overall visitor experience. This acts as a centralized platform where customers can browse the paintings, purchase tickets, view upcoming events, and organizers or administrators can manage exhibitions and artwork information more efficiently using this user-friendly interface. In this first implementation scenario we will focus on the customer side features and how a customer can interact with the application interface like creating an account or logging in, browsing exhibitions and artworks, viewing event details, and making ticket or artwork purchases.

Scenario - 1: Login + Explore the Customer level/interface

The user starts the application AEMS which shows the welcome screen and goes ahead to login to their account. If they don't have one, they create one. While giving details when creating an account, users will be assigned a role based on which they will be able to view and access relevant features of the application/system. The customer main dashboard will contain the options to

- View/Buy Arts
- View upcoming events
- Buy Exhibition Tickets
- Make Payments

On selecting the button option for “**View Upcoming Events**”, the user will be able to get the list of upcoming and ongoing events like the available exhibitions with basic details like venue, date, location, ticket price. On clicking on a particular event the user liked, it will generate a pop up window which will include more detailed information about that event including artist name, artwork preview, and event description.

On each event there will be a button option to “**Buy Ticket**”. The user chooses “Buy ticket” for a specific event/exhibition and the system asks for the ticket quantity and proceeds to the payment page. The customer enters the payment details and purchases the tickets successfully. The system generates a confirmation message for successful purchase and displays the digital ticket id on screen. There will also be an option where the system asks the user if they want digital tickets

sent to the customer's mobile no/ email address as preferred by them. The user can return to the main dashboard or logout of the system.

Similarly, when the customer clicks the option **View/Buy Arts**, the system will generate the gallery of available art works along with the name of the artist. There will be an option to “**View More**” which will then show the extended information about the selected artwork like the preview images of the paintings (3D view), prices, description, dimensions and availability. There will be an option to buy a particular artwork. The user selects the option “**Buy Art**” if that artwork is available and then the system proceeds to the payment page and the customer receives a confirmation after successful transaction.

The gallery page will also have a **search and filter option** so that the customers can quickly find the artworks based on artist name, price range, or category.
